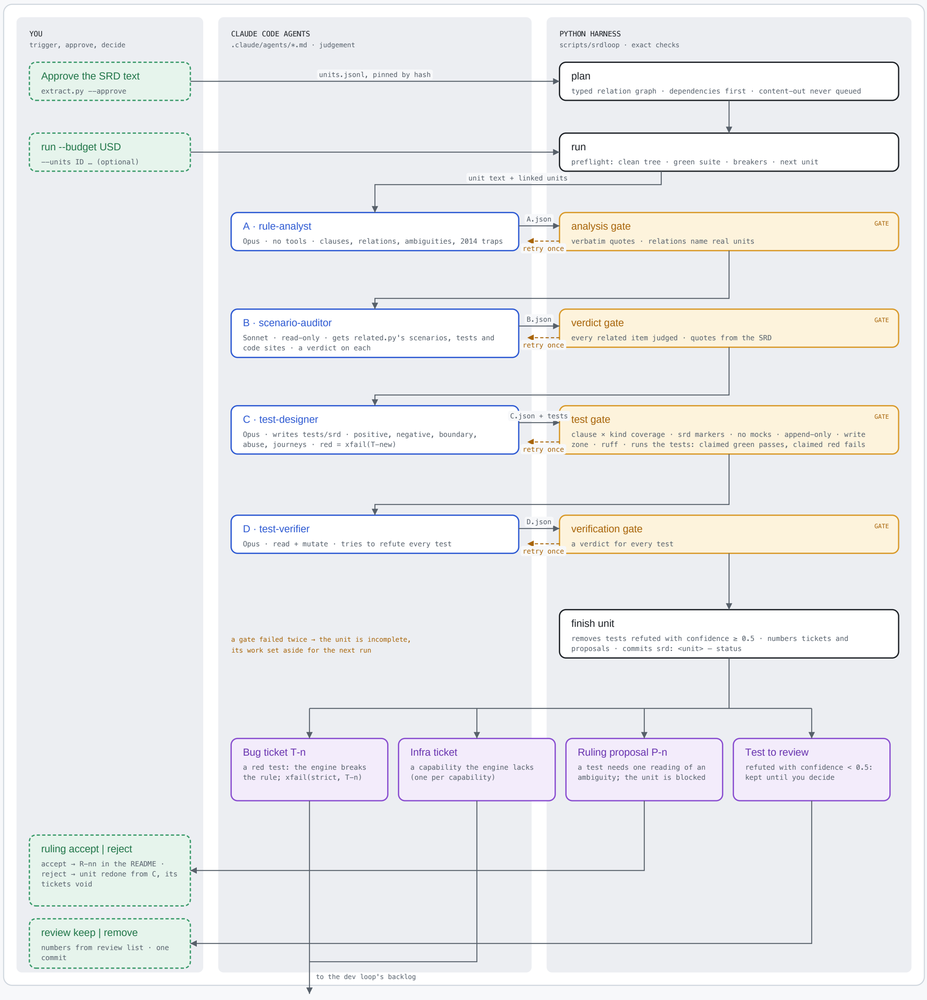
# SRD Rule Loop

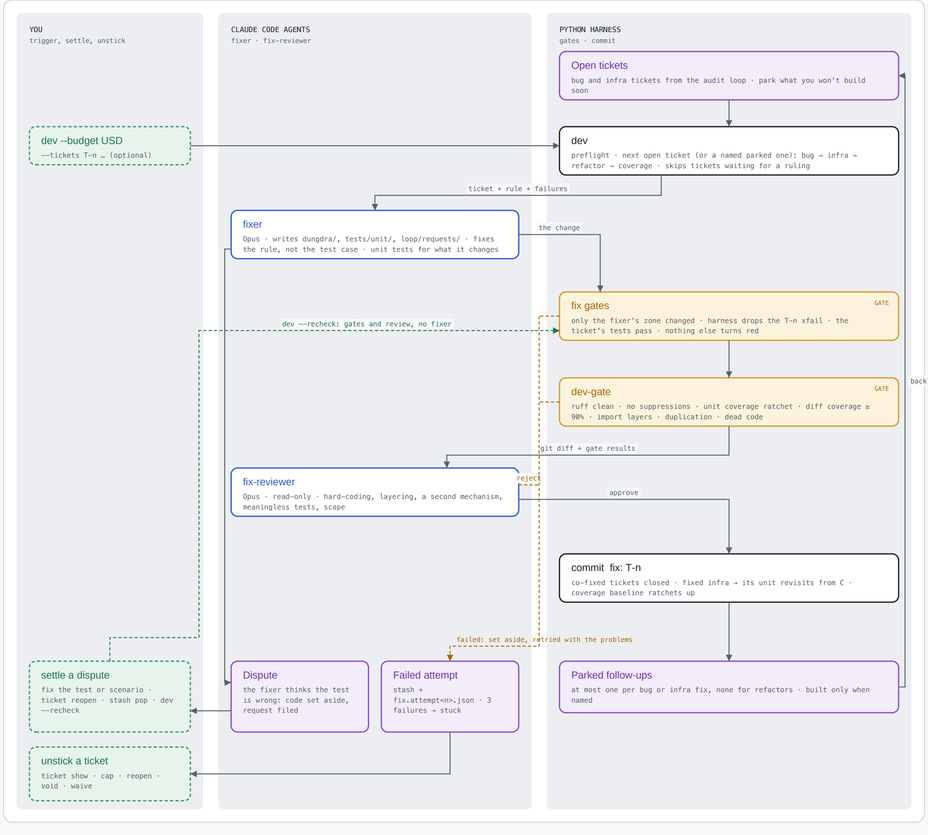
The DungDra engine is checked against the D&D SRD 5.2.1, one rule unit at a time and breadth-first. Four agents analyse the rule, audit what exists, write tests and try to refute them. A separate dev loop fixes what the tests find. Scripts check every agent's output before it counts, and what only a person can decide (readings of the rules, disputes, removals) waits for you.

Claude Code agent (fresh context, restricted tools) · Python harness · Gate: rejects or retries · Discovery · You

## Audit loop: one rule unit, stages A to D



## Dev loop: one ticket at a time



### Stops by itself

Exit 3, a circuit breaker: the suite was red before starting · more than 15 open bugs (run the dev loop first) · 3 units in a row failed their gates. Exit 4, paused: budget, a usage or session limit, or a call that didn't run; the same command resumes, a failed unit at its failed stage. `status` lists everything waiting for you; /srd-triage turns it into one sheet.

### Always on, in every agent call

- **Write zones** per role: a PreToolUse hook (SRDLOOP_ROLE) and the gates block anything else.
- **settings.json** denies git push, commit, reset, stash, rm, curl, pip; sandbox on.
- **--json-schema** makes each stage's output checkable; --max-budget-usd caps each call.
- **CLAUDE.md** carries the rules every role shares: append-only suites, no suppressions.

### Only you decide

- **Rulings:** accept into the README register, or reject with a reason.
- **Disputes and stuck tickets:** ticket show, reopen, void, cap, waive.
- **Tests:** removing or weakening one; the verifier's doubts (review).
- **Scope:** the SRD text (extract --approve) and which infra to build.

### Traceability

- **Code:** # SRD[<unit>#<clause>] where a rule is implemented.
- **Events:** page=, rule="<unit>#<n>" and ruling="R-nn" in the log.
- **Attempts:** every stage and fix attempt kept in loop/runs/, with cost.
- **Commits:** one per unit, fix and decision, with the reason.

### So far

| 17 | 398 | 93 | 73 | 34 | $3.50 |
|---|---|---|---|---|---|
| units audited | SRD tests kept | tickets (34 bug, 31 refactor, 24 infra, 4 coverage) | tickets fixed | rulings accepted | per audited unit |
